Installing New Templates/Themes

(applies to phpPennyAuction v2.4+)

To install a new template, you will need to do as follows. Installation takes only a couple of seconds. Please note, this documentation is provided on as "as is" basis, and is intended to be a helpful resource. There is a lot more documentation available to all clients, at https://members.phppennyauction.com.

1. **Choose which template(s) you want** on your website. A preview of most of the templates is available at http://www.phppennyauctiondemo.com. Download the .zip file from the License Area -> Templates folder.

2. **Unzip the file to your hard drive** for now -   try to remember where you're saving it to!

3. **Upload the entire folder** to your web server, to the highest level. In most cases this will be /public_html or /html   (It needs to be in the same folder where you can see the /admin and /cake/ folders).

4. **Open up the config.php file** (in the /config/ folder) and change the "*theme*" setting to match the folder name <u>exactly</u>. For example: if you downloaded the 'Whale' theme, this folder name is *'template_whale'*. You should upload the entire '*/template_whale/*' folder and contents, and then change this value:

   theme => 'template_whale',

5. **Save the config.php file back** to the server, and refresh your website. This new theme is now installed.
